

Tally Integration — Meeting Brief

Date: 7 April 2026
Prepared by: Development Team
Project: FluxGen Expense Tracker

1. What We've Already Built (Phase 1 — Ready to Use)

Tally XML Export (Accountant Page)

The accountant dashboard has a fully functional **Tally Export** section:

Feature	Description
Voucher Selection	Accountant sees all approved vouchers ready for export with checkboxes
Batch XML Generation	Generates Tally-compatible XML with multiple vouchers in one file
XML Preview	Full-screen preview with syntax highlighting before download
Download XML	Saves .xml file — ready to import into Tally Prime
Export Tracking	Marks vouchers as "Exported to Tally" to prevent duplicates
Export History	Shows which vouchers have already been exported
Ledger Mapping	Maps expense categories (Transportation, Meals, Fuel, etc.) to Tally ledger names
Tally Settings	Configurable company name and payment ledger (Cash/Bank)

How It Works Today

Employee submits expense → Manager approves → Accountant approves
→ Accountant goes to "Tally Export" tab
→ Selects approved vouchers
→ Clicks "Download XML"
→ Opens Tally Prime → Import → Select XML file → Done

XML Format Generated

```
<?xml version="1.0" encoding="UTF-8"?>
<ENVELOPE>
  <HEADER>
    <VERSION>1</VERSION>
    <TALLYREQUEST>Import</TALLYREQUEST>
    <TYPE>Data</TYPE>
    <ID>Vouchers</ID>
  </HEADER>
  <BODY>
    <DESC>
      <STATICVARIABLES>
        <SVCURRENTCOMPANY>FluxGen Technologies Pvt Ltd</SVCURRENTCOMPANY>
      </STATICVARIABLES>
    </DESC>
    <DATA>
      <TALLYMESSAGE>
```

```
<VOUCHER>
  <DATE>20260406</DATE>
  <NARRATION>VCH-2026-001 | Chaithanya | Site visit expenses</NARRATION>
  <VOUCHERTYPENAME>Payment</VOUCHERTYPENAME>
  <VOUCHERNUMBER>VCH-2026-001</VOUCHERNUMBER>
  <ALLEDGERENTRIES.LIST>
    <LEDGERNAME>Travelling Expenses</LEDGERNAME>
    <ISDEEMEDPOSITIVE>Yes</ISDEEMEDPOSITIVE>
    <AMOUNT>-1500.00</AMOUNT>
  </ALLEDGERENTRIES.LIST>
  <ALLEDGERENTRIES.LIST>
    <LEDGERNAME>Cash</LEDGERNAME>
    <ISDEEMEDPOSITIVE>No</ISDEEMEDPOSITIVE>
    <AMOUNT>1500.00</AMOUNT>
  </ALLEDGERENTRIES.LIST>
</VOUCHER>
</TALLYMESSAGE>
</DATA>
</BODY>
</ENVELOPE>
```

2. What We Plan to Build (Phase 2 — Live Integration)

Tally Bridge — Local Node.js Server

A small server that runs on the **accountant's laptop** (same machine as Tally) and enables live push/pull.

Feature	Description
Push to Tally	One-click export — vouchers are pushed directly into Tally, no manual XML import
Import Ledgers	Pull chart of accounts (ledger names, groups) from Tally into the web app
Two-Way Sync	Match expenses in both systems, detect what's already imported
Connection Status	Web app shows if Tally bridge is running and Tally is reachable

Architecture

How It Will Work

1. Accountant installs Node.js (one-time)
2. Runs `npm start` in the bridge folder (or we make a desktop shortcut)
3. Web app detects bridge is running (shows green indicator)
4. Accountant clicks "Push to Tally" — vouchers go directly into Tally

5. Accountant can also pull ledger names from Tally for mapping

3. Information Needed from Tally Team

Required Before Phase 2 Development

#	Question	Why We Need It
1	Tally version — Tally Prime or Tally ERP 9?	API format differs slightly between versions
2	ODBC/HTTP Server enabled?	Tally must have this turned ON (F12 → Advanced → ODBC Server = Yes)
3	Tally port	Default is 9000, but may be changed. What port is Tally listening on?
4	Company name in Tally	Exact name as it appears in Tally (e.g., "FluxGen Technologies Pvt Ltd")
5	Chart of Accounts / Ledger List	List of ledger names used in Tally for expenses. We need to map our categories to their ledgers
6	Payment ledger name	What's the payment source? "Cash", "Bank Account", "Petty Cash"? Multiple?
7	Voucher Type	Are they using "Payment" voucher type, or a custom one like "Expense Reimbursement"?
8	Cost Centers	Do they use cost centers in Tally? If yes, should we map projects to cost centers?
9	Multi-currency?	All transactions in INR, or do they handle foreign currency?
10	Who does the import?	Only the accountant, or multiple people? (affects bridge setup)

Required for Ledger Mapping

We need the **exact ledger names** from Tally for these expense categories:

Our Category	Tally Ledger Name (fill in)
Transportation - Auto	?
Transportation - Cab (Uber/Rapido)	?
Transportation - Metro	?
Transportation - Toll	?
Fuel - Petrol	?
Fuel - Diesel	?
Meals - Food	?
Accommodation - Room/Hotel	?
Parking	?
Miscellaneous - Xerox	?
Miscellaneous - Fine	?
Local Conveyance - Auto	?

Nice to Know

#	Question	Purpose
11	Tally data path	Where Tally stores data (for backup verification)
12	GST enabled?	Do expense vouchers need GST entries?
13	Approval in Tally?	Does Tally have its own approval workflow, or do they rely on our app?
14	Employee as Party?	Should each employee be a "Party" ledger in Tally for reimbursement tracking?
15	Budget tracking?	Do they track departmental budgets in Tally? Should advances sync?

4. What We Need from the Accountant

Item	Details
Laptop access	30 minutes to install Nodejs and test the bridge
Tally running	Tally must be open with the company selected
Ledger list export	Screenshot or export of their chart of accounts from Tally
Test voucher	Permission to push one test voucher into Tally to verify format
Network info	Is Tally on a local machine or a shared server? Firewall rules?

5. Timeline Estimate

Phase	What	Duration
Phase 1	XML Export (already done)	Completed
Phase 2a	Build Tally Bridge server	2-3 days
Phase 2b	Import ledgers from Tally	1 day
Phase 2c	One-click push to Tally	1 day
Phase 2d	Two-way sync + status tracking	2-3 days
Testing	End-to-end with real Tally data	1-2 days
Total Phase 2		~1-2 weeks

6. Demo Flow for Meeting

You can show this live in the meeting:

1. **Login** as accountant → accountant.html
2. Go to **Tally Export** in sidebar
3. Show approved vouchers listed with checkboxes
4. Select a voucher → click **Preview XML**
5. Show the formatted XML with ledger entries
6. Click **Download XML** → show the `.xml` file
7. Open Tally Prime → Gateway → Import Data → select the XML file

8. Show the voucher created in Tally

This demonstrates Phase 1 is working. Phase 2 would replace steps 6-8 with a single "Push to Tally" button.

7. Key Technical Points

- **Tally API** is XML-based HTTP on localhost:9000 (not REST/JSON)
- **No cloud API** — Tally doesn't expose a cloud endpoint, so we need a local bridge
- **Bridge is lightweight** — ~100 lines of Node.js, runs silently in background
- **Security** — Bridge only talks to localhost (Tally) and Supabase (our DB). No external exposure
- **Fallback** — If bridge is down, XML download still works (Phase 1)
